

Intro to Linux

Basic Terminal

ssh	<ul style="list-style-type: none"> • short for secure shell • usage: <code>ssh [host]@[computer].[otherIPstuff]</code> <ul style="list-style-type: none"> ◦ for lab computers: <code>ssh [CSID]@[comp].cs.utexas.edu</code> ◦ can get a list of active computers from the UTCS web page by searching "lab machines" • works natively for Macs and Linux machines • for Windows machines will need to use Putty <ul style="list-style-type: none"> ◦ WinSCP is also a great program for Windows • there is also a secure shell extension for Chrome
[ctrl] + [alt] + t	<ul style="list-style-type: none"> • this will open up a new terminal window for you • is super convenient on the computers in the lab
[up arrow]	<ul style="list-style-type: none"> • this will bring up the last command you used in the your terminal <ul style="list-style-type: none"> ◦ if used multiple times will keep going up in your command history • can be useful when using long/ repeated commands • the down arrow will go back through commands in the other direction
history	<ul style="list-style-type: none"> • this will print out a list of your previous terminal commands • can be useful if you are trying to remember a complex command you did previously but can't quite remember
clear	<ul style="list-style-type: none"> • this will totally clear your terminal screen • can be useful when have just run something really complex and would like a clean slate
man	<ul style="list-style-type: none"> • short for manual • usage: <code>man [something confusing]</code> <ul style="list-style-type: none"> ◦ example: <code>man grep</code> • will give you helpful usage information about certain commands/ system calls <ul style="list-style-type: none"> ◦ is especially useful to look at the flags for commands
echo	<ul style="list-style-type: none"> • this will basically just print something to your terminal window • usage: <code>echo "hello world"</code>

	<ul style="list-style-type: none"> is really useful in bash scripts <ul style="list-style-type: none"> NOTE: bash scripts are a way to run a collection of terminal commands as a single command
[ctrl] + c	<ul style="list-style-type: none"> this will stop whatever is currently running in your terminal can be especially useful when you accidentally run a program with an infinite loop <ul style="list-style-type: none"> Or any other long running program/ script that you want to stop
[ctrl] + [shift] + c	<ul style="list-style-type: none"> this will let you copy something from you terminal useful if trying to Google what an error means
[ctrl] + [shift] + v	<ul style="list-style-type: none"> this will let you paste into the terminal useful if just Googled a way to do something cool
sudo	<ul style="list-style-type: none"> short for super user do will allow you to run commands you normally aren't allowed to usage: sudo [command] <ul style="list-style-type: none"> NOTE: you cannot run sudo on the lab machines
exit	<ul style="list-style-type: none"> will close out of the terminal window without having to hit the little x in the corner

Directories and Files

ls	<ul style="list-style-type: none"> short for list lists all the files/ directories in the current directory you might also want to try the sl command on the lab machines
ls -al	<ul style="list-style-type: none"> will list all the files in the current directory along with their permissions permissions: <ul style="list-style-type: none"> read - can view the stuff write - can edit the stuff execute - can run (for scripts and such) 3 sets <ul style="list-style-type: none"> (owner) (group) (anyone)
pwd	<ul style="list-style-type: none"> short for print working directory any easy way to know where you are in the file hierarchy if you forget
cd	<ul style="list-style-type: none"> short for change directory used to navigate between directories in your file structure usage: cd [directory] <ul style="list-style-type: none"> can use "cd .." to go back up the directory structure can also put in a full path instead of just a directory name <ul style="list-style-type: none"> "/" at front of directory will be an absolute path from your root

	<ul style="list-style-type: none"> directory <ul style="list-style-type: none"> ■ no "/" at front of directory will be a relative path ■ "." just means current directory so ./hello.txt is the same as hello.txt
[tab]	<ul style="list-style-type: none"> this will autocomplete whatever you are currently doing in the terminal ex: <code>cd Doc + [tab]</code> would autocomplete Doc to Documents without you having to type out the whole thing
mkdir	<ul style="list-style-type: none"> short for make directory will make a new directory for you usage: <code>mkdir [directory name]</code> <ul style="list-style-type: none"> NOTE: can also use relative vs. absolute paths instead of just a directory name
cp	<ul style="list-style-type: none"> short for copy a way to make a copy of something in a different directory usage: <code>cp [source/file name] [destination]</code> <ul style="list-style-type: none"> again can use relative or absolute paths for the source and destination NOTE: This copies to destination and keeps the original in source as well
scp	<ul style="list-style-type: none"> short for secure copy a way to copy files between computers usage: <code>scp [source] [destination]</code> <ul style="list-style-type: none"> from other computer: <code>scp [host]:[source/file name] [destination on your computer]</code> to other computer: <code>scp [source/file name] [host]:[destination on other computer]</code>
mv	<ul style="list-style-type: none"> short for move a way to actually move files/directories around on your computer <ul style="list-style-type: none"> also an easy way to rename directories usage: <code>mv [source] [destination]</code> <ul style="list-style-type: none"> as usual you can use either a relative or absolute path for the source and destination
rm	<ul style="list-style-type: none"> short for remove deletes a file usage: <code>rm [file name]</code> helpful things: <ul style="list-style-type: none"> <code>rm -rf [directory name]</code> <ul style="list-style-type: none"> will delete a directory and everything inside it use with caution, if you don't give a destination for this it will delete EVERYTHING from your current directory down
touch	<ul style="list-style-type: none"> will either create a new file or update the last modified date on a file to the current date

	<ul style="list-style-type: none">• usage: touch [file]															
cat	<ul style="list-style-type: none">• short for catenate• will print a file's contents to the terminal• usage: cat [file]															
chmod	<ul style="list-style-type: none">• used to change permissions• usage: chmod [new settings] [file]• new setting options <table><tr><td>Reference</td><td>Operator</td><td>Mode</td></tr><tr><td>u - user</td><td>add</td><td>r - read</td></tr><tr><td>g - group</td><td>remove</td><td>w - write</td></tr><tr><td>o - others</td><td>= set exactly</td><td>x - execute</td></tr><tr><td>a - all (everybody)</td><td></td><td></td></tr></table>	Reference	Operator	Mode	u - user	add	r - read	g - group	remove	w - write	o - others	= set exactly	x - execute	a - all (everybody)		
Reference	Operator	Mode														
u - user	add	r - read														
g - group	remove	w - write														
o - others	= set exactly	x - execute														
a - all (everybody)																
grep	<ul style="list-style-type: none">• a way to search through file(s)• usage: grep [search for] [file]<ul style="list-style-type: none">◦ can search for things using regex• helpful flags:<ul style="list-style-type: none">◦ -n lists the line number next to matches◦ -r search recursively◦ * instead of a file name will search the whole directory															
find	<ul style="list-style-type: none">• used to find out where a file lives in your file hierarchy• usage: find [path] -name [file]<ul style="list-style-type: none">◦ if path is not given then will search the current directory and every directory it contains															
diff	<ul style="list-style-type: none">• short for difference• shows the difference between 2 files• usage: diff [file 1] [file 2]• helpful flags:<ul style="list-style-type: none">◦ -b ignore white space diffs◦ -i ignore case◦ --side-by-side - see differences next to each other															

Redirection Input/ Output

 	<ul style="list-style-type: none"> • will make the output from command on the left the input for the command on the right • ex: <code>man hello grep "hello"</code> <ul style="list-style-type: none"> ◦ will search for the word hello in the man pages for hello (this will actually work on the lab machines)
----------	--

> and >>	<ul style="list-style-type: none"> • will redirect output on left into the file on the right • single > will replace the contents of the file with the given output and double >> will append to the file • ex: <code>echo "hello" > hello.txt</code> • ex: <code>cat [file1] [file2] > [file3]</code>
<	<ul style="list-style-type: none"> • will redirect thing on the right to be the input for the thing on the left • ex: <code>ProgramTakesInAge < 12</code> • is really good for testing projects that take in user input

Java Specific

<code>java -version</code>	<ul style="list-style-type: none"> • will tell you what version of Java is currently installed on your machine • will also tell you if java is not installed on your machine at all
<code>javac</code>	<ul style="list-style-type: none"> • used to compile a java program • usage: <code>javac [file]</code> <ul style="list-style-type: none"> ◦ must have the .java extension • if successful will create a .class file with the same name as the original Java file
<code>java</code>	<ul style="list-style-type: none"> • used to run a compiled Java file • usage: <code>java [name of .class file]</code> <ul style="list-style-type: none"> ◦ ex: <code>java Test</code> <ul style="list-style-type: none"> ■ don't put .class at the end of the file name ■ this would have come from compiling a file called Test.java

UTCS Specific

<code>lpq</code>	<ul style="list-style-type: none"> • short for list printer queue <ul style="list-style-type: none"> ◦ or at least that is how I remember it • will give you a list of pending jobs on a given printer • usage: <code>lpq -P[printer name]</code> <ul style="list-style-type: none"> ◦ no space between the -P and the printer's name ◦ the Linux printer in the 3rd floor lab is lw301
<code>lprm</code>	<ul style="list-style-type: none"> • can use to remove all your pending jobs from a printer's queue • usage: <code>lprm -P[printer name] [CSID]</code> • very useful if the printer is backed up/ not working and you need to run to class soon without worrying about wasting paper
<code>chkquota</code>	<ul style="list-style-type: none"> • short for check quota • each UTCS student only gets a certain amount of space so it is important to check how much you are using at any given time • if you reach 100% you will stop being able to save files/ do certain things • NOTE: caching on certain browsers can cause this quota to fill up

	quickly, to fix just clear your cache folder
du -sk ~/* ~/.??* sort -n	<ul style="list-style-type: none"> • will basically tell you which files are using the most memory • super useful if your disk quota is at 100% and you need to figure out what to delete

Fun Stuff

cal	<ul style="list-style-type: none"> • will give you a little ASCII calendar of the current month with the current day highlighted • can be useful when you are having a tired moment and forget what your life looks like
date	<ul style="list-style-type: none"> • will give you the current date and time as a string • again useful if you are having a tired moment and just need to know time still works properly
yes	<ul style="list-style-type: none"> • will print the same phrase repeatedly in your terminal until you hit [ctrl] + c • usage: yes [some words]
cowsay	<ul style="list-style-type: none"> • will take a phrase and print a little ASCII art cow saying that phrase • usage: cowsay "[some words]" • can also pipe things into cowsay <ul style="list-style-type: none"> ◦ you could have a cow tell you your grep output • there are also many other animals you could do <ul style="list-style-type: none"> ◦ for a list do cowsay -l ◦ usage for different animal: cowsay -f [animal file] [some words] ◦ ■ ex: cowsay -f dragon-and-cow "hello"
fortune	<ul style="list-style-type: none"> • will print a random fortune to your screen <ul style="list-style-type: none"> ◦ there are some fun flags for this like, you should man fortune to see what they are • these are particularly fun to pipe into cowsay
xeyes	<ul style="list-style-type: none"> • will pop up a screen with little eyes on your screen that will follow your cursor around • can be entertaining when you are super stressed/ tired • NOTE: won't work over ssh

[**SUGGEST AN EDIT**](#)
